

Optical power of the photometer module

Overview

Also known as saturation optical power, it refers to the maximum average optical power that the receiver component of the optical module can receive under a certain bit error rate (BER=10⁻¹²) condition. wired connection to the controller. The spectrum of the light source is also cut wi be outputted, but stored as off for fast kinetics measurements. Time required mbe (XXXX) if definThe photometer-module is a complete photometer for the measurement of optical density of liquids at one or two wavelengths, depending on version. The optical power meter is used to find the maximum optical intensity quickly when integrated in fully automatic, optical FMPA alignment systems. optek sensors have a variety of wavelength options to meet all. To learn more about our camera-based photometry systems, check out our VOA-100 (Visual Optical Aim). The PHOTO-100 Series of extremely accurate Ethernet data servers apply a very precise silicon sensor, precision amplifier system, scaling network and on-board computer, producing digital photometric.
