

Optoelectronic Convergence Communication

Overview

Photonics-electronics convergence hardware technology functionally combines optical devices and electronic devices used for communication devices in order to achieve higher performance, higher functionality, and more compact size that could not be achieved with a single device. CPO is positioned as a key implementation architecture for enhancing the communication and power efficiency of the entire AI infrastructure, including GPUs, switches, and networks. When a circuit is miniaturized to $1/k$, the area becomes $1/k^2$, the power consumption becomes $1/k^2$, and the performance per unit area becomes k^2 . This supports strong demand for. Optical Active Devices and Modules 2. Access/Data Center/Core Networks and Subsystems 5. Quantum Photonics, Optical Sensing and Imaging Optica is the leading society in optics. Second-generation photonics-electronics convergence devices are designed for use in digital coherent optical transceivers, which play an important role in optical communication network systems. The R&D themes in which NTT will.
