

Outdoor fiber optic cable weighs over one meter

Article Overview

Outdoor fiber optic cables typically weigh between 60 and 200 kilograms per kilometer, which translates to roughly 60 to 200 grams per meter, with armored cables exceeding 200 grams per meter.

Typical Weight Ranges

Outdoor fiber optic cables are heavier than indoor cables due to additional protective layers such as UV-resistant jackets, water-blocking gels, and sometimes metal armoring for physical protection . General weight estimates are:

- Standard outdoor cables: 60–200 kg per kilometer ($\approx 60\text{--}200$ g per meter)
- Armored outdoor cables: Often exceed 200 kg per kilometer (≈ 200 g per meter or more)
- Indoor cables for comparison: 10–30 kg per kilometer ($\approx 10\text{--}30$ g per meter) The exact weight depends on factors like fiber count, cable diameter, type of armor, and materials used in the jacket and strength members .

Factors Affecting Cable Weight

- Protective Layers: Outdoor cables include extra layers to resist UV, water ingress, rodents, and mechanical stress, adding 10–20% more weight compared to indoor cables .
- Armoring: Metal or dielectric armor significantly increases weight, especially for direct-burial applications
