

Papua New Guinea Active Optical Devices

LPO

Article Overview

Linear Pluggable Optics (LPO) are emerging as a key active optical component in Papua New Guinea, offering low-latency, high-efficiency optical transceivers for modern data and telecom networks.

What are Linear Pluggable Optics (LPO)?

Linear Pluggable Optics (LPO) are advanced optical transceivers designed to simplify signal processing by moving digital functions from the module to the host device. Unlike traditional DSP-based optics, LPO modules use high-linearity analog components such as lasers, photodiodes, drivers, and transimpedance amplifiers (TIAs), while the host ASIC handles digital signal processing. This design results in lower power consumption, reduced latency, and higher efficiency, making LPO ideal for data centers, AI clusters, and high-speed network applications .

LPO Technology Advantages

- Lower latency: By removing the DSP from the module, signal processing occurs in the host, reducing delay.
- Energy efficiency: Analog-only modules consume less power than DSP-based optics.
- Simplified design: Fewer components in the module reduce complexity and cost.
- Compatibility: Fully compatible with modern high-speed network architectures .
