

Power patch cord connection method for distribution box

Article Overview

Proper connection of power patch cords in a distribution box involves correct cable preparation, termination, labeling, and testing to ensure reliable performance and safety.

Cable Preparation and Termination

- Select the appropriate patch cord based on connector type and cable category (e.g., Cat6, Cat6A, SC-SC, FC-FC) for the distribution box and connected devices .
- Strip the outer jacket carefully using a wire stripper or small knife to expose the conductors without damaging them .
- Arrange the wires according to the wiring standard (T568A or T568B for Ethernet) or the specific pinout required for power or optical connections .
- Insert the wires into the terminal slots or keystone jack, ensuring each conductor is fully seated .
- Crimp or press the wires firmly using a crimping tool or punch-down tool to secure the connection .
- Trim any excess cable to prevent interference or short circuits .

Cable Management

- Control cable length to avoid slack; typically, patch cords from splitters to user terminals are kept within 50 cm to 3 m depending on the application .
- Use cable organizers or zip ties to secure cords inside the distribution box, preventing strain or accidental disconnection
