

Protection power of the three-level distribution box

Overview

Install the Level 3 surge protection device inside the equipment or at the equipment's power supply input, especially for critical or sensitive electronic devices. Technical Requirements Maximum discharge capacity: 20kA per phase or lower. Though dependable and robust, this philosophy does not cover a wider area for defense against catastrophic failures to provide higher reliability and resiliency. According to GB 50054 and IEC 60364 standards, low-voltage distribution systems are typically divided into three levels. According to the principle of graded lightning protection, and based on the likelihood of a building being struck by lightning, it is necessary to deploy surge protector against lightning in stages to. (1) Power distribution from the primary main distribution board (distribution cabinet) to secondary distribution boards can be branched; that is, one main distribution board may supply power via multiple branch circuits to several secondary distribution boards. (2) Similarly, power distribution. The electricity supply chain consists of three primary segments: generation, where electricity is produced; transmission, which moves power over long distances via high-voltage power lines; and distribution, which moves power over shorter distances to end users (homes, businesses, industrial sites. However, the distribution of electrical energy comes with inherent risks. High voltages and currents, if not properly managed, can lead to system faults, equipment damage, fire hazards, and even fatal accidents. The human body, for instance, can generally tolerate currents below 50 milliamperes.
