

Protective Material for Distribution Boxes

Article Overview

Distribution boxes are typically made from metals like steel or stainless steel, or high-grade plastics such as polycarbonate, PVC, and fiberglass-reinforced plastic, chosen for durability, fire resistance, and environmental protection.

Metal Enclosures

Steel and stainless steel are commonly used for industrial or outdoor distribution boxes due to their high impact resistance, structural strength, and corrosion resistance. Galvanized steel or stainless steel is preferred in humid, coastal, or chemically aggressive environments to prevent rust and maintain long-term durability. Metal boxes can also provide fire resistance, especially when lined with flame-retardant coatings, and are suitable for high-traffic or harsh industrial areas.

Plastic Enclosures

Polycarbonate, PVC, and fiberglass-reinforced plastics are widely used for residential, commercial, and light-duty industrial applications. These materials are lightweight, shatter-resistant, and electrically insulating, making them safer for indoor use or areas with lower physical impact. High-grade thermoplastics offer UV stability, flame retardancy, and chemical resistance, which is essential for outdoor installations exposed to sunlight, rain, or temperature fluctuations. Polycarbonate can withstand temperatures above 100°C, ensuring protection of internal components under thermal stress.
