

Protective sleeve for optical distribution box

Article Overview

A protective sleeve for an optical distribution box safeguards fusion-spliced fibers from mechanical stress, bending, and environmental damage, ensuring long-term network reliability.

Purpose and Function

Protective sleeves are used to cover and protect the splice joint after two optical fibers are fused together. The exposed glass at the splice is extremely fragile, and the sleeve restores mechanical integrity, prevents bending, and shields the splice from moisture, vibration, and handling damage, maintaining stable communication quality in telecommunications and data networks .

Materials and Design

Most protective sleeves are made from cross-linked polyolefin heat-shrinkable tubes, sometimes combined with hot melt adhesives and a stainless steel rod as a tension member. This design provides both mechanical and environmental protection. Some sleeves also use ethylene vinyl acetate inner layers to create a moisture-resistant barrier after shrinkage . Advanced designs include pre-shrunk, flexible, mini, and micro sleeves suitable for single fibers or mass ribbon fibers .

Installation Process

- Slide the sleeve onto the fiber before performing the fusion splice....
