

Router directly connected to fiber optic cable China Telecom

Article Overview

A router cannot connect directly to a fiber optic cable; you need an Optical Network Terminal (ONT) to convert the fiber signal into an Ethernet signal your router can use.

Key Components Required

- **Optical Network Terminal (ONT):** Provided by China Telecom, the ONT converts the incoming optical signal from the fiber into an electrical signal compatible with standard routers .
- **Fiber Optic Cable:** Typically single-mode with SC/APC or SC/UPC connectors, supplied by your ISP .
- **Router:** A standard router with a WAN or SFP port to receive the Ethernet signal from the ONT. Ensure it supports gigabit speeds to fully utilize fiber performance .
- **Ethernet Cable:** Cat5e or Cat6 cable to connect the ONT to the router's WAN port .

Step-by-Step Connection Process

- **Install the ONT:** Locate the fiber wall outlet where China Telecom's fiber enters your home. Connect the fiber optic cable from the wall outlet to the ONT's optical port. Power on the ONT and wait for the status lights to stabilize .
- **Connect ONT to Router:** Use an Ethernet cable to link the ONT's LAN port to your router's WAN port. This allows the router to receive the converted electrical signal .
- **Power Up and Configure Router:** Turn on the router and access its admin panel via a web browser. Enter any ISP-provided credentials if required. Ensure the router is configured to handle the high-speed fiber connection .
- **Verify Connection:** Check the router's indicator lights and test internet connectivity...
