

Router shows no fiber optic cable

Article Overview

A standard router cannot directly accept a fiber optic cable; you need an Optical Network Terminal (ONT) to convert the fiber signal into Ethernet for your router.

Why Your Router Has No Fiber Cable

Fiber optic internet uses light signals transmitted through specialized cables, which cannot be directly interpreted by most home routers. The fiber line from your Internet Service Provider (ISP) terminates at an Optical Network Terminal (ONT), which converts the optical signal into a standard electrical signal that your router can use . Without an ONT, the router cannot process the fiber signal, which is why you don't see a fiber cable plugged directly into it.

How to Connect Fiber Internet to Your Router

- Install the ONT: Your ISP typically provides and installs the ONT near the point where the fiber enters your home. The fiber cable plugs into the ONT's optical port .
- Connect the ONT to the Router: Use a high-quality Ethernet cable (Cat6a or higher) to link the ONT's Ethernet output to your router's WAN port .
- Power On and Configure: Turn on the ONT and router, then check the router's interface to ensure it receives an internet signal. Some routers may require enabling Quality of Service (QoS) or other settings for optimal performance .
- Optional Fiber-Ready Router: For maximum speeds, especially with gigabit or multi-gigabit fiber, use a router that supports high-speed Ethernet or SFP/SFP+ modules .
