

Secondary distribution box for electrical isolation

Article Overview

A secondary distribution box, or sub-distribution box, safely distributes power to a specific area while providing electrical isolation and protection for downstream circuits.

Overview

A secondary distribution box (also called a sub-box or Class II distribution box) is used to manage and distribute electrical power from a primary distribution panel to a localized area or group of equipment. It typically includes a main isolation switch, fuses or circuit breakers, and branch circuit protection, allowing for safe control and isolation of electrical loads. These boxes are essential for implementing three-level power distribution, where the primary panel feeds secondary boxes, which in turn feed individual equipment or switch boxes.

Key Components

- **Main Isolation Switch:** Disconnects the entire secondary box from the primary supply for maintenance or emergency purposes.
- **Circuit Breakers or Fuses:** Protect individual circuits from overloads or short circuits.
- **Bus Bars:** Distribute power efficiently to multiple branch circuits.
- **Enclosure:** Made from materials like polycarbonate, ASA, or powder-coated steel to ensure mechanical strength, insulation, and environmental protection
