

Service life standard of distribution box

Article Overview

The typical service life of low-voltage distribution boxes ranges from 20 to 50 years, depending on material, installation environment, and maintenance.

Metal Distribution Boxes

Metal distribution boxes, often made from high-strength cold-rolled steel (Q195) with anti-corrosion treatment, are designed for indoor low-voltage applications in residential, commercial, and industrial settings. These boxes comply with IEC 60439-3 standards and feature robust construction, reinforced structural integrity, and high mechanical durability, which contribute to a long service life . With proper installation and maintenance, metal distribution boxes can reliably operate for 30-50 years, particularly in environments with controlled temperature and humidity .

Plastic Distribution Boxes

Plastic distribution boxes, typically made from flame-resistant ABS or PC materials, are widely used in residential buildings and support modular components like MCBs and RCDs. These enclosures also comply with IEC 60439-3 standards and are designed for indoor use . Due to material aging and environmental factors, the service life of plastic boxes is generally 20-30 years, though high-quality manufacturing and proper maintenance can extend this period.

Optical Fiber Distribution Boxes

For optical fiber distribution boxes, service life depends heavily on material quality,...
