

Specifications and dimensions of a 4-story data center power distribution box

Article Overview

A 4-story data center power distribution box is typically a modular, multi-tier PDU system designed to deliver high-capacity, redundant power to IT equipment, with dimensions and specifications varying by manufacturer but generally following standard rack or floor-mounted modular designs.

General Design and Structure

A 4-story PDU system in a data center is usually modular, with each “story” representing a separate tier or section of the distribution box. These tiers can be stacked vertically to optimize space and provide redundant power paths (Side A and Side B) for Tier III or Tier IV data centers . Each tier may include:

- Circuit breakers or fuses for branch protection
- Busbars or power rails for high-current distribution
- Monitoring and metering modules
- Surge protection and isolation switches
- Optional intelligent controllers for remote monitoring and management

Typical Dimensions

While exact dimensions depend on the manufacturer and power rating, modular PD...
