

Specifications of distribution boxes in power distribution rooms

Article Overview

Power distribution boxes must be properly rated, safely installed, and equipped with protective devices to ensure reliable and code-compliant power distribution.

Key Specifications

Enclosure and Material Requirements: Distribution boxes should use corrosion-resistant materials and meet appropriate NEMA or IP ratings for indoor or outdoor use. Common NEMA types include Type 1 for indoor protection, Type 3R for outdoor weather resistance, and Type 4 for protection against water and ice formation . Materials should withstand environmental conditions, including humidity, dust, and potential chemical exposure .

Internal Components: A typical distribution box contains a busbar, neutral and earth bars, MCBs, RCDs, RCBOs, fuses, isolators, and surge protective devices. The internal layout must allow for proper cable management, heat dissipation, and future expansion . DIN rail-mounted terminal blocks and screw-clamping connections are recommended for stable mechanical and electrical performance .

Wiring and Electrical Ratings: Use high-temperature resistant copper conductors sized according to load current requirements. All wiring should be clearly labeled, properly insulated, and routed to avoid exposure or short circuits. Grounding of the metal enclosure, electrical boards, and internal devices is mandatory, and a leakage protector should be installed for additional safety . Rated current and short-circuit capacity must match the facility's load and fault conditions .
