

Stainless Steel Cable Tray Types

Article Overview

A stainless steel cable tray includes the tray body, support structures, fittings, and accessories designed to organize, protect, and support electrical cables in various environments.

Core Components

1. Tray Body: The main part of a stainless steel cable tray is the tray body, which can come in different designs depending on the application :

- Ladder-Type Trays: Feature side rails connected by rungs, ideal for heavy cables and maximum ventilation.
- Perforated Trays: Have holes along the base for air circulation and moisture drainage.
- Solid Bottom Trays: Provide full protection for sensitive cables from dust, debris, or water . 2. Material Types: Stainless steel trays are made from different alloys to suit environmental conditions :

- SS201: Low-cost, suitable for dry indoor areas with minimal corrosion risk.
- SS304: Standard choice for most environments, offering good corrosion resistance.
- SS316L: High-end option with low carbon and molybdenum, ideal for harsh environments like coastal areas, chemical plants, and food processing facilities . 3.

Support Structures: Cable trays require supports to maintain stability and load-bearing capacity. These include:

- Splice Plates: Connect two tray sections.
- Support Spans: Distance between supports varies by tray length and load, typically 6–20 feet depending on installation type
