

# Standard parts for galvanized cable trays

## Article Overview

Standard galvanized cable tray systems include straight sections, bends, tees, elbows, drop-outs, supports, covers, and accessories, all designed to resist corrosion and comply with industry standards.

### Common Components

**Straight Sections:** These are the main runs of the cable tray, available in ladder, trough, solid bottom, or channel types. They form the backbone of the cable management system and are typically made from structural steel, pre-galvanized or hot-dip galvanized for corrosion resistance . **Fittings:** Essential for changing direction or branching the tray system, fittings include:

- Bends and elbows for horizontal or vertical turns
  - Tees for branching cable runs
  - Drop-outs for cable exit points
  - Reducers to transition between different tray widths
- Supports and Brackets:** These secure the trays to walls, ceilings, or other structures. Standard supports include wall brackets, trapeze hangers, and cantilever arms, designed to maintain stability and load capacity . **Covers and Splice Plates:** Covers protect cables from dust, debris, and environmental exposure. Splice plates, along with bolts, nuts, and washers, connect tray sections securely. For hot-dip galvanized trays, covers and splice plates are also hot-dip galvanized after fabrication to ensure uniform corrosion protection . **Accessories:** Additional parts include clamps, cable ties, grounding kits, and end caps. These ensure proper cable organization, safety, and compliance with electrical codes
