

Steel wire of mesh cable tray

Article Overview

Mesh cable trays are typically made from steel, including stainless steel (304, 316), carbon steel, and galvanized or powder-coated finishes, chosen for strength, corrosion resistance, and environmental suitability.

Common Steel Materials

Stainless Steel 304: This is the industry standard for most indoor and industrial applications due to its excellent durability and corrosion resistance, making it ideal for data centers, manufacturing, and commercial infrastructure projects .

Stainless Steel 316: Recommended for high-salinity or chemically aggressive environments,

such as coastal facilities or food processing plants, because it offers superior resistance to corrosion compared to 304 stainless steel . **Carbon Steel:** Often used in welded wire mesh trays, carbon steel provides high tensile strength and rigidity. It can be finished with powder coating or zinc plating for indoor applications .

Galvanized and Coated Options

Electro-Galvanized Steel: Suitable for indoor use, this steel is coated with a thin layer of zinc (typically around 12 microns) to prevent corrosion .

Hot-Dip Galvanized Steel: Designed for outdoor or harsh environments, this steel has a thicker zinc coating (60-80 microns) for long-term corrosion protection . **Powder-Coated Steel:** Provides a cost-effective, protective finish for controlled indoor environments, enhancing aesthetics and corrosion resistance .

Design Considerations...
