

Switching Power Supply Cabinet Row Cabinet

Article Overview

Switching power supply cabinets and row cabinets are specialized units designed to distribute, monitor, and protect electrical power for server racks in data centers, ensuring reliable and uninterrupted operation.

Overview

Switching power supply cabinets are designed to manage and distribute power from multiple AC sources, such as utility grids or uninterruptible power supply (UPS) systems, to IT equipment. They provide automatic switching between power sources to maintain continuous operation in case of a failure, and often include Molded Case Circuit Breakers (MCCBs) for short-circuit and overload protection, as well as surge protection devices to guard against voltage transients and lightning strikes . Row cabinets, also known as End-of-Row (EoR) Power Distribution Cabinets, are positioned at the front or end of a row of server racks. They supply either AC or DC power to the entire row, supporting high-density deployments while simplifying cable management and improving airflow . These cabinets typically feature power distribution, monitoring, metering, protection, and alarm systems, and are often equipped with dual power inputs for redundancy, ensuring uninterrupted power delivery in mission-critical environments .

Key Features

- Dual Power Inputs: Allow automatic failover between two power sources, enhanci...
