

TP-Link switch optical port connection

Article Overview

To connect a TP-Link switch via an optical port, use a compatible SFP/SFP+ module with the correct fiber cable, ensure Tx/Rx alignment, and configure speed and duplex settings properly.

Hardware Setup

- **Insert SFP/SFP+ Modules:** TP-Link switches require an SFP or SFP+ module in the optical port to establish a connection. These modules are hot-swappable and support multiple transmission media and protocols .
- **Choose the Correct Fiber Cable:** Use single-mode or multi-mode fiber according to the module type. Multi-mode modules often emit a visible red laser, while single-mode modules do not .
- **Align Tx and Rx Ports:** Ensure the transmit (Tx) port of one module connects to the receive (Rx) port of the other device, and vice versa .

Configuration

- **Speed and Duplex:** Verify that both switches' SFP ports operate at the same speed (e.g., 1000 Mbps) and duplex mode. TP-Link switches often support Auto Duplex mode, which helps negotiate with other brands .
- **Link Aggregation (Optional):** Multiple SFP ports can be grouped into a Link Aggregation Group (LAG) to increase bandwidth and reliability. Configure LAG or LACP on both switches before connecting the cables .

Troubleshooting

- **LED Status:** The SFP port LED only lights up when the connection is fully established. If the LED is off, check the module, fiber cable, and Tx/Rx alignment
