

Taboos of Home Electrical Distribution Boxes

Article Overview

Avoiding improper installation, poor grounding, combustible materials, and messy wiring are key taboos for home electrical distribution boxes.

Key Taboos and Their Consequences

1. Not inspecting the distribution box upon arrival Failing to inspect the box can result in missing grounding bolts, insufficient protective earth wire cross-section, loose wire-to-device connections, reverse loops, non-galvanized screws, improper conductor sizes, missing color coding, and lack of N and PE terminal blocks, which can compromise safety and delay project schedules .
2. Inadequate protective earthing Connecting protective earth wires incorrectly or using undersized conductors can lead to electric shock hazards. All protective earth conductors must connect to a PE busbar, with cross-sections meeting or exceeding the largest branch circuit conductor .
3. Using combustible or untreated wooden materials Wooden distribution boxes without flame-retardant treatment are prone to mold, leakage, and fire hazards, especially in humid or dusty environments. Only non-combustible or flame-retardant materials should be used .
4. Improper installation and elevation Boxes that are not firmly installed, not vertical, or with edges not close to the wall can affect functionality, aesthetics, and long-term durability. Recommended installation heights are 1.5m for the bottom edge of the box and 1.8m for the bottom of the switchboard .
5. Disorderly or unbound wiring Messy wiring can damage insulation, cause short circuits, and complicate maintenance. Wires should be neatly coiled, bundled, and arranged to avoid tight pressure against pipes .
6. Missing N and PE busbars Withou...
