

Techniques and methods for peeling the white skin off tail fibers

Article Overview

Peeling the white skin off a tail fiber involves carefully gripping the base, cutting connective tissue as needed, and pulling the skin downward in a controlled motion to avoid tearing.

Preparation

Before starting, gather the necessary tools: a sharp, thin, flexible knife (such as a skinning or fillet knife) and protective gloves to prevent cuts and contamination. Ensure the animal is fresh, as skin removal is easier and the pelt is less likely to be damaged when the carcass is recently harvested .

Step-by-Step Technique

- **Expose the Tail Base:** Begin by peeling the pelt down the hind legs to expose the base of the tail. Make small cuts around the tail if necessary to free connective tissue .
- **Grip the Tail Firmly:** Hold the tail at its base with one hand, ensuring a secure but gentle grip. This provides control without damaging the skin .
- **Cut Connective Tissue:** Use the knife to carefully sever any remaining connective tissue attaching the skin to the tailbone. Avoid cutting too deeply to prevent damage to the pelt .
- **Use a Tail Stripper (Optional):** For animals like raccoons, a tail stripper can be clamped around the tailbone. Pull the tailbone out slowly while holding the base of the tail, freeing the skin from the underlying structure
