

Temperature controller for network cabinet cooling

Article Overview

Temperature controllers for network cabinets regulate internal heat using thermostats, smart fans, or air-conditioning units to protect sensitive electronics from overheating.

Smart Fan Modules

Smart rack fan modules, such as the 1U Intelligent Rack Fan Module, are compact units designed for 19-inch server racks. They feature built-in temperature sensors and thermostats that automatically adjust fan speed based on the internal cabinet temperature, ensuring efficient cooling and energy savings while extending equipment life. These modules are ideal for space-constrained environments and can be installed in data centers, telecom cabinets, or industrial control enclosures .

Programmable Fan Systems

Dual-fan rack mount systems provide programmable thermostat control, allowing users to set temperature thresholds at which fans activate. These systems often include an LCD display and temperature probe, enabling precise monitoring and automatic adjustments to maintain optimal airflow. They are suitable for server racks, AV equipment, and network cabinets, offering high airflow (e.g., 150 CFM) while remaining quiet and energy-efficient .
