

The network fiber optic cable has been unplugged

Article Overview

A "network cable unplugged" message usually indicates a physical disconnection or a network adapter issue, and can be resolved by checking the cable, ports, and adapter settings.

Check the Physical Connection

Ensure that the fiber optic cable is securely plugged into both your computer and the router or switch. Inspect the cable for any visible damage, fraying, or kinks, as a damaged cable will prevent connectivity. If possible, test the cable with another device to confirm it is functioning properly. Also, check the ports on your computer and router for dust or debris that may interfere with the connection .

Restart and Reset Network Hardware

Perform a hard reboot of your computer and networking equipment. For a desktop, turn off the computer, unplug the power cable, and wait 15 minutes before reconnecting. For laptops, remove the battery if possible. After reconnecting, enable the network adapter and plug the cable back in .

Check Network Adapter Settings

- Press Win + R, type ncpa.cpl, and press Enter to open Network Connections.
- Right-click your Ethernet adapter and select Disable, then right-click again and select Enable....
