

The optical module is stuck on the network port

Overview

First, confirm that the optical port is enabled. The optical module cannot be properly identified and optical module information cannot be obtained. This type of optical module failure mainly includes port not UP, port status is UP but do not receive or send messages, port frequently up or down and CRC error. Whether you are dealing with a no link light, intermittent connectivity (link flapping), or a transceiver not detected error, the root cause is often not immediately obvious. In many cases, encountering a stuck SFP (Small Form-factor Pluggable) module can be frustrating for IT technicians and network administrators. There are. In most cases, SFP-related faults are not caused by the module itself but by factors such as fiber contamination, incorrect cable polarity, incompatible optics, or configuration mismatches.
