

Three-phase power protection device

Overview

A 3 phase voltage protector monitors the voltage across all three phases of a power supply. If your operations rely on heavy equipment, motors, or sensitive electronics running on a three-phase supply, then a 3 phase voltage protector is essential. Three-phase power is often found in factories, offices, and big buildings. This way, they even protect sensitive end devices, such. 3-phase power is a method of alternating current (AC) generation, transmission, and distribution that uses three electrical conductors, each carrying AC voltage of the same frequency and amplitude but offset by 120 degrees—one-third of a 360-degree cycle as shown in Figure 1—to provide that power. These SPDs are housed in an enclosure to protect them from conditions like water, corrosive substances, or dust.

Protect against three phase power faults.

Phase-Guard is a self contained power sensing device. It operates on the principle of phase voltage unbalance which may occur in a three phase system. It also provides protection against phase loss.
