

Trough-type ladder-type cable tray

Article Overview

Ladder-type cable trays feature open rungs for maximum airflow and heavy cable support, while trough-type (ventilated) trays have a solid or perforated bottom for moderate airflow and enhanced cable protection.

Ladder-Type Cable Tray

Design and Structure: Ladder trays consist of two longitudinal side rails connected by evenly spaced rungs, resembling a ladder. The open design allows air to circulate freely around the cables, promoting heat dissipation and preventing moisture accumulation . **Applications:** Ideal for heavy-duty power cables, long horizontal runs, and industrial environments such as power plants, substations, and petrochemical facilities . Ladder trays are commonly used for single conductor cables and Type MV cables, as specified by NEC standards . **Advantages:**

- Maximum ventilation and heat dissipation
- Easy cable installation and maintenance
- Supports heavy cable loads over long spans
- Reduces dust accumulation and prevents moisture from entering equipment

Considerations: Wider rung spacing or tray widths may reduce load capacity, so proper design is essential .

Trough-Type (Ventilated) Cable Tray

Design and Structure: Trough-type trays have a solid or perforated bottom with raised side rails. The perforations allow controlled airflow while providing more cont...
