

Types of Stainless Steel Fireproof Cable Trays

Article Overview

Fire-resistant stainless steel cable trays are available in ladder, channel, and perforated styles, typically made from 304 or 316 stainless steel for high heat and corrosion resistance.

Stainless Steel Grades

- 304 Stainless Steel: Offers excellent corrosion resistance and durability, suitable for most industrial and commercial applications .
- 316 Stainless Steel: Contains molybdenum, providing superior resistance to corrosion, especially in marine, chemical, and offshore environments . Both grades maintain structural integrity under high temperatures, making them suitable for fire-resistant installations in high-risk areas such as hospitals, data centers, and oil and gas facilities .

Structural Styles

- Ladder Style: Features rungs connecting two side rails, allowing excellent air ventilation and heat dissipation. Ideal for heavy cable loads and fire-prone areas .
- Channel Style: A solid or partially enclosed tray that protects cables from dust and debris while providing moderate ventilation. Often used in chemical plants and tunnels .
- Perforated Style: Includes holes along the tray base for ventilation and drainage, suitable for environments requiring both cable protection and airflow
