

Vietnam Special PM Polarization Maintaining Fiber Optic Patch Cord Coating

Article Overview

Polarization-Maintaining (PM) fiber optic patch cords in Vietnam feature specialized coatings and construction to preserve polarization, minimize insertion loss, and ensure high extinction ratios for sensitive optical applications.

Fiber Coating and Construction

PM fiber optic patch cords are designed to maintain the polarization state of light along the fiber. The fibers are typically single-mode and utilize tight-buffered or low-stress coatings to reduce angular misalignment and stress-induced birefringence. Coatings can include PVC, LSZH, or double-armored stainless steel jackets for mechanical protection, depending on the application and environmental requirements. Some high-performance variants also feature AR-coated ends to reduce reflection and improve signal quality.

Extinction Ratio and Performance

The extinction ratio (ER) is a key parameter for PM fibers, indicating how well the fiber preserves polarization. Typical ER values range from 18 to 25 dB, ensuring minimal polarization drift. Advanced PM fibers use low-stress bonding and precise fiber alignment to maintain high polarization extinction across a wide wavelength range (405–1620 nm). Insertion loss is minimized, and return loss values often exc...
