

What are the different mesh cable tray solutions

Article Overview

Wire mesh cable trays, also known as basket trays, are lightweight, open-grid systems ideal for low-voltage, telecommunication, and fiber optic cables, offering flexibility, ventilation, and easy installation.

Overview of Wire Mesh Cable Trays

Wire mesh cable trays are constructed from welded steel wires forming an open-grid structure, which allows for excellent airflow and heat dissipation around cables, making them particularly suitable for data centers, IT networks, and telecommunications facilities. Their open design also enables easy visual inspection, routing, and management of cables, and simplifies modifications or upgrades without major disassembly.

Key Types and Variations

While wire mesh trays are generally similar in structure, they can vary based on:

- **Material:** Commonly made from galvanized steel, stainless steel, or aluminum, depending on environmental conditions and corrosion resistance requirements.
- **Finish:** Options include powder-coated or PVC-coated trays for additional protection in humid or corrosive environments.
- **Size and Span:** Mesh trays come in various widths and depths to accommodate different cable volumes and can be cut or joined to fit specific layouts
