

What are the power strips in a network cabinet called

Article Overview

A network cabinet power strip is commonly called a "rack mount power strip" or a "Power Distribution Unit (PDU)."

Overview

In IT and networking environments, a rack mount power strip or PDU is used to distribute electrical power to multiple devices within a server rack or network cabinet . Unlike standard household power strips, these units are designed for high-density equipment setups, providing reliable power, surge protection, and sometimes advanced monitoring features.

Types and Features

- **Basic Rack Mount Power Strips:** Simple strips with multiple outlets for powering servers, switches, and other network devices .
- **Switched or Metered PDUs:** Allow individual outlet control and monitoring of power usage, helping manage energy efficiency and prevent overloads .
- **Intelligent or Smart PDUs:** Offer remote monitoring, environmental sensors, and integration with data center management software for real-time power management .
- **Vertical vs Horizontal Mounting:** Power strips can be mounted horizontally across the rack or vertically along the side, depending on space and cable management needs
