

What does a router with fiber optic access look like

Article Overview

A fiber optic router typically looks like a compact, rectangular box with multiple Ethernet ports, indicator lights, and sometimes external antennas, designed to connect to an ONT rather than directly to a fiber cable.

Physical Appearance

A fiber optic router is usually a small, flat, rectangular device, often in black or white, similar in size to standard home routers. Many models have external antennas to enhance Wi-Fi coverage, though some modern units use internal antennas for a sleeker design. The front or top of the router typically features LED indicator lights showing power, internet connectivity, and Wi-Fi status. The back or side includes multiple Ethernet ports for wired connections to computers, smart TVs, or other devices.

Connection Setup

Unlike traditional cable routers, a fiber optic router does not connect directly to the fiber optic cable. Instead, it connects to an Optical Network Terminal (ONT), which converts the light signals from the fiber into electrical signals that the router can distribute via Wi-Fi or Ethernet. The ONT itself is usually a small rectangular box with fiber input and Ethernet output ports, often mounted on a wall or placed on a shelf near the fiber entry point
