

What does network security equipment include

Article Overview

Network security equipment mainly consists of firewalls, intrusion detection and prevention systems, VPN gateways, network access control, unified threat management systems, and security monitoring tools.

Core Network Security Devices

Firewalls act as the first line of defense, monitoring and controlling incoming and outgoing network traffic based on predefined security rules. They can be hardware or software-based and block unauthorized access while allowing legitimate communication . Intrusion Detection Systems (IDS) monitor network traffic for suspicious activity and generate alerts when potential threats are detected, helping administrators respond to attacks . Intrusion Prevention Systems (IPS) go a step further by actively blocking malicious traffic in real-time . Virtual Private Networks (VPNs) provide secure, encrypted connections over public networks, enabling remote users to safely access internal resources . Network Access Control (NAC) enforces policies to ensure that only authorized and compliant devices can connect to the network, reducing the risk of unauthorized access . Unified Threat Management (UTM) systems combine multiple security functions—such as firewall, antivirus, content filtering, and intrusion prevention—into a single appliance, simplifying management for smaller networks . Security Information and Event Management (SIEM) tools collect and analyze security data from across the network, providing centralized monitoring, threat detection, and compliance reporting
