

What is an ALRFM distribution box

Article Overview

An ALRFM distribution box is an alarmed enclosure used in Protected Distribution Systems (PDS) to secure and monitor fiber optic or wireline network connections against tampering or intrusion.

Overview

An ALRFM (Alarmed Local Remote Fiber Module) distribution box is a specialized enclosure designed to house network cables, typically fiber optic or wireline, while providing physical security and intrusion detection. It is commonly used in classified or sensitive network environments, such as government or military facilities, where unencrypted National Security Information (NSI) is transmitted .

Functionality

- **Intrusion Detection:** The ALRFM box integrates sensors that detect physical tampering, accidental damage, or unauthorized access to the cables inside .
- **Layer 1 Security:** It provides Layer 1 network security, meaning it protects the physical layer of the network, ensuring that any attempt to access or compromise the cables is immediately detected .
- **Integration with PDS:** These boxes are part of a Protected Distribution System, which is a network of hardened and alarmed enclosures and raceways designed to safeguard unencrypted NSI while allowing routine network operations .
- **Flexible Installation:** ALRFM boxes can be installed in secure raceways, EMT conduits, or armored interlocking fiber systems, either above ceilings, below floors, or in standalone secure enclosures
