

What kind of protection should the distribution box be equipped with

Overview

Include protection devices like breakers, fuses, and surge protectors—each circuit should have its own protection. Comply with standards: Follow NEC, IEC, or local codes. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. You must make safety your top priority when working with low voltage distribution boxes. Circuit breakers and RCDs alone don't provide complete protection—they handle. A distribution board (DB) is the central component of any power distribution system, providing a safe and organized way to deliver electricity from the main supply to individual circuits. Check for proper IP/NEMA ratings and material quality. Avoid installing in a humid and corrosive environment to prevent equipment damage.
