

What material is best for fiber optic patch cords

Article Overview

Fiber optic patch cords are best made with glass or plastic cores, aramid (Kevlar) strength members, and jackets such as LSZH, PVC, or plenum-rated materials depending on the installation environment.

Core and Cladding Materials

The core of a fiber optic patch cord is typically made of high-purity glass for single-mode or multimode fibers, providing low signal loss and high bandwidth over long distances. Plastic cores are sometimes used for short-distance or cost-sensitive applications. Surrounding the core is the cladding, also made of glass or plastic, which reflects light back into the core to maintain signal integrity and prevent leakage .

Strength Members

To enhance durability and prevent breakage, patch cords include strength members, usually made of aramid yarn (Kevlar). This material provides tensile strength without compromising flexibility, allowing the cable to withstand pulling, bending, and handling during installation .

Jacket Materials

The outer jacket protects the fiber from environmental hazards and mechanical da...
