

What quota applies to the terminal box

Article Overview

The quota for a terminal box is determined by summing the volume allowances for all conductors, devices, grounding conductors, clamps, and terminal blocks according to NEC 314.16.

Key Considerations for Terminal Box Fill

1. Conductors: Each current-carrying conductor entering the box counts as one volume allowance based on its AWG size. For example, #14 AWG requires 2.0 cubic inches per conductor, while #12 AWG requires 2.25 cubic inches . Conductors that pass through without termination are counted once, and short pigtails entirely within the box are generally not counted . 2. Grounding Conductors: All equipment grounding conductors together count as one allowance, based on the largest conductor size present . 3. Devices: Each switch, receptacle, or similar device counts as two allowances of the largest conductor connected to it . 4. Internal Cable Clamps: Each internal clamp adds one allowance to the total box fill . 5. Terminal Blocks: For boxes containing terminal blocks, one volume allowance per terminal block assembly is required, based on the largest conductor terminated to the block . This is a new addition in the 2023 NEC to ensure proper spacing and prevent overcrowding.

Calculation Steps

- Identify all conductors entering the box and their AWG sizes.
- Count devices (switches, receptacles) and multiply by two allowances.
- Include grounding conductors as one allowance.
- Add internal cable clamps as one allowance each.
- Add terminal blocks as one allowance per assembly....
