

Which AP panel supports fiber optic internet

Overview

Fiber Connected Access Point: Uses fiber optic cabling to connect directly to fiber backbones over much longer distances — hundreds of meters to kilometers — without additional converters. Its core function is the same as a normal AP—broadcasting Wi-Fi signals to allow wireless-capable devices to connect. However, significant differences exist between them. The panels will enable Cisco's customers to facilitate breakout connectivity agnostic of the data rate. The Cisco® solution of panel and cable assemblies offers versatile solution for any breakout. The AP LIBERTY® is a rugged, cost-effective fiber distribution hub designed for outdoor fiber-to-the-home (FTTH) deployment in rural and residential broadband applications. Rated NEMA Type 3R and 4X, this fiber distribution hub (FDH) enclosure delivers the weatherproof protection, field. A fiber patch panel (also called an ODF or optical distribution frame) is the central termination point where incoming fiber optic cables meet your active network equipment. Without one, you're left with a tangled mess of unterminated fiber strands and no way to reconfigure connections without. This chapter contains information on AP accessories and instructions on installing antennas, grounding the AP, and powering the AP. It contains the following sections: All versions of 1570 series access points have 4x4:3 2.4 GHz radios and 4x4:3 5 GHz radios. We offer multiple fiber optic patch panels including LC, ST, SC, FC, MTRJ, and MPO connector options.
