

Wire exit from distribution box iron conduit

Article Overview

When exiting a distribution box through an iron (metal) conduit, wires must be protected, properly secured, and the conduit correctly terminated using appropriate fittings to ensure safety and grounding.

Conduit Termination

For metal conduits such as Rigid Metal Conduit (RMC) or Intermediate Metal Conduit (IMC), the conduit should be threaded and screwed directly into the distribution box hub, secured with a locknut inside the box to maintain mechanical stability and electrical continuity for grounding purposes (Engineer Fix), . This ensures the wires are protected from mechanical damage and environmental exposure.

Fittings and Connectors

- Set-screw connectors: Suitable for dry, indoor locations; screws bite into the conduit wall to hold it in place.
- Compression fittings: Provide a more secure and moisture-resistant connection by tightening a metal ferrule around the conduit (Engineer Fix), . The choice of fitting depends on the conduit type and installation environment.

Securing Wires

Once the conduit is terminated, wires exiting the conduit must be secured inside th...
