

# Wireless Coverage Aggregation Switch

## Article Overview

A wireless coverage aggregation switch consolidates traffic from multiple wireless access points and access switches, providing high-bandwidth, reliable connectivity to the core network while supporting redundancy and traffic management.

### Function and Role

A wireless coverage aggregation switch acts as an intermediary between access layer devices—including wireless access points (APs), servers, and edge switches—and the core network. It aggregates traffic from multiple APs, ensuring that data from wireless clients is efficiently forwarded to core switches or routers without creating bottlenecks. This is particularly important in enterprise, campus, or high-density wireless environments where multiple APs serve hundreds of users simultaneously .

### Key Features

- **Link Aggregation:** Supports protocols like Link Aggregation Control Protocol (LACP) or static link aggregation to combine multiple physical links into a single logical connection, increasing bandwidth and providing failover in case of link failure .
- **Layer 2/3 Operations:** Can operate at Layer 2 for switching and VLAN segmentation or Layer 3 for routing between subnets, depending on network topology .
- **Quality of Service (QoS):** Prioritizes traffic from critical applications or specific users, ensuring smooth performance for latency-sensitive services like VoIP or video conferencing .
- **VLAN Tagging:** Isolates wireless traffic into separate broadcast domains to improve security and manage network segmentation ....
