

Wiring in explosion-proof distribution boxes

Article Overview

Explosion-proof distribution boxes must be wired using certified cables, proper grounding, and compliant installation methods to ensure safety in hazardous environments.

Key Wiring Principles

1. Power Isolation and Safety: Before any wiring, ensure the main power supply is turned off to prevent electrocution or electrical hazards. Use circuit breakers or isolators to disconnect the supply safely . 2. Cable Selection:

- Use cables rated for hazardous areas, typically marked with EX or ATEX certification.
- Choose flame-resistant, impact-resistant, and mechanically robust cables.
- For power lines in explosion-hazardous zones, aluminum core wires of at least 4mm² or copper core wires for higher hazard levels are recommended; lighting circuits may use 2.5mm² cross-section . 3. Terminal Connections:
- Connect incoming power to the designated terminal blocks, ensuring correct live, neutral, and earth connections.
- Tighten all terminals securely and verify connections with a multimeter or continuity tester . 4. Grounding:
- Proper grounding is critical. Use the dedicated earth terminal to safely direct stray currents or faults to the ground, preventing fire or shock hazards . 5. Inlet and Outlet Positioning:....
