

Wiring the three-phase energy meter junction box

Article Overview

A three-phase energy meter junction box is wired by connecting the three-phase supply lines to the meter, integrating current transformers (CTs) for high-current loads, and ensuring proper neutral, earthing, and protection devices.

Understanding the Components

- **Three-Phase Supply Lines (R, Y, B):** These are the live wires carrying the three-phase voltage to the load.
- **Neutral Wire:** Provides a return path for current and stabilizes the system.
- **Current Transformers (CTs):** Used when the load exceeds the meter's direct measurement capacity, scaling high currents to a safe level (typically 1A or 5A) for the meter.
- **Protection Devices:** Fuses or MCBs on voltage input lines protect the meter and wiring from overloads.
- **Earthing:** The meter body must be grounded to prevent electric shock and ensure safety.

Step-by-Step Wiring Process

- **Install CTs on Incoming Phases:** Place CTs on the R, Y, and B phase lines going to the load. Ensure correct polarity: P1 on the source side and P2 on the load side. Each CT has secondary terminals S1 and S2. Short S1 and S2 when not connected to prevent high voltage buildup. Connect S2 terminals to the meter's neutral current input or as per the meter model....
